

DC499 — Stock Control Report Suite

Designed and built by Dean Karim.

Browser-based productivity reporting tools for DC499 warehouse operations. No backend, no installation — open in any browser and go.

Live site: <https://yourusername.github.io/dc499-reports>

Files

File	Version	Department	Description
Menu_v1.5.html	v1.5	All	Navigation hub — launch any app from here
Ecom_v2.3.html	v2.3	Ecom	Replenishment, Putaway, Full Report (6 sub-depts)
Reserve_v1.4.html	v1.4	Reserve Stock	Picking, Replenishment
ItemPrep_v1.9.html	v1.9	Item Prep	Item Level Receive, Condition Code
Receiving_v1.6.html	v1.6	Receiving	LPN Receive
MegaDash_v1.0.html	v1.0	Leadership	Cross-dept Shift Dashboard + Weekly Tracker
index.html	—	—	Root redirect to Menu

All files must stay in the same folder. Menu navigation uses relative paths.

How it works

Each app follows the same pattern:

1. Supervisor exports a CSV from the WM portal
2. CSV is dropped into the app (drag and drop or file picker)
3. PapaParse parses it client-side — data never leaves the browser
4. JavaScript filters and aggregates by roster member

5. Results render with Chart.js

State (roster, goals, theme) persists in `localStorage` per device.

Critical data rules

These rules are hard-won from real bugs. Do not change them without understanding why.

Never use CP Trace Id for dedup. CP Trace Id is shared across multiple legitimate transactions for the same employee. Using it for dedup previously caused 723 missing replen units (3,226 → 2,503). Always dedup on `Employee + Transaction ID + Activity Datetime`.

Putaway uses Transaction ID, not Transaction Type. Using `Transaction Type = 'Putaway'` incorrectly caught replen fill rows. Fixed to use Transaction ID (`System Directed Putaway`, `User Directed Putaway`). Do not revert.

Sorting requires a second filter. `OB Sort To Putwall Cubby` has multiple Criteria values in the export. Only `NRDR_SORT_TO_PUTWALL_CUBBIES_CRITERIA` counts. All other criteria values must be excluded.

Sorting exports exceed the WM portal row cap (~9k rows). When Sorting is included, exports grow from ~7k to ~9k rows. Workaround: export in time block splits and merge using the Full Report multi-file drop zone. The cross-file dedup handles the seam correctly.

Transaction IDs by app

Ecom v2.3

Tab	Transaction IDs	Metric
Replenishment	iLPN Replen Fill, Retail iLPN Replen Pull, iLPN Replen Pull, iLPN Replen Fill Large, iLPN Replen Pull Large	Sum Completed Quantity
Putaway	System Directed Putaway, User Directed Putaway	Count rows

Tab	Transaction IDs	Metric
Full Report — Picking	Ecom Mezz Pick To Putwall Cart, Ecom Non-Mezz Pick To Putwall Cart	Sum Quantity
Full Report — Packing	NRDR CORE PACK FOR ECOM PACK STATION	Sum Quantity
Full Report — Shipping	OB Putaway By Ship Via	Sum Quantity
Full Report — Sorting	OB Sort To Putwall Cubby	Sum Quantity (filter: NRDR_SORT_TO_PUTWALL_CUBBIES_CRITERIA only)

Reserve Stock v1.4

Tab	Transaction IDs	Metric
Picking	Non Haz Retail Pick To oLPN Cart	Sum Quantity
Replenishment	iLPN Replen Fill, iLPN Replen Fill Large	Sum Completed Quantity

Item Prep v1.9

Tab	Transaction IDs	Metric
Item Level Receive	Item Level Receive	Sum Quantity, dedup by Container ID
Condition Code	IlpnConditionCodeRemoval	Sum Quantity, dedup by Container ID

Receiving v1.6

Tab	Transaction IDs	Metric
LPN Receive	LPN Level Receive, Small Parcel LPN Level Receive	Count unique Container IDs per employee

CSV columns required

Every WM export must contain these columns for the apps to work:

Employee · Transaction ID · Transaction Type · Activity Datetime · Completed Quantity ·
Quantity · Container ID · Criteria · CP Trace Id

MegaDash — cross-dept dashboard

MegaDash accepts structured JSON payloads exported from each dept app. It does not process raw CSVs.

Payload format

```
json
{
  "dept":      "ecom",
  "shift":     "2nd",
  "date":      "2026-06-23",
  "exportedAt": 1719100000000,
  "units":     1240,
  "goal":      1400,
  "tabs": [
    { "label": "Replenishment", "units": 820 },
    { "label": "Putaway",      "units": 420 }
  ],
  "roster":    25,
  "version":   "2.3"
}
```

dept must be one of: ecom · reserve · itemprep · receiving (lowercase)

Loading data into MegaDash

Manual: Drop a .json file or paste the payload code into the Today tab.

Auto-folder (desktop Chrome/Edge only): Click "Connect folder" and select a shared OneDrive/Teams folder. MegaDash scans it every 60 seconds and auto-ingests any new dept export files it finds.

Weekly tracker

The This Week tab builds automatically from daily exports — no extra steps. Each time a

dept export is loaded on the Today tab it is date-stamped and saved to week history. History resets every Monday.

localStorage keys

Key	App	Content
dc499_megadash_v1	MegaDash	Today's dept payloads
dc499_megadash_history_v1	MegaDash	Weekly history (current week only)
dc499_megadash_theme_v1	MegaDash	Theme preference
dc499_megadash_folder_v1	MegaDash	Last connected folder name
dc499_ecom_theme_v1	Ecom	Theme
sc_roster_2nd_v5 / sc_roster_1st_v1	Ecom	2nd/1st shift roster
sc_goals_v1	Ecom	Goals
dc499_reserve_theme_v1 / rs_roster_v1 / rs_goals_v1	Reserve	State
dc499_itemprep_theme_v1 / ip_roster_2nd_v1 / ip_roster_1st_v1 / ip_goals_v1	ItemPrep	State
dc499_receiving_theme_v1 / recv_roster_v1 / recv_goals_v1	Receiving	State

Roster key versioning: When changing the default roster, bump the storage key version (e.g. v5 → v6) so browsers drop the old saved roster and reload the new defaults.

Versioning convention

Change	Version bump
Bug fix, small feature	v2.3 → v2.4 (subversion)

Change	Version bump
New tab or major feature	v2.x → v3.0 (major)

Update version in three places when bumping:

1. Settings footer `<p class="nordstrom-tag">vX.X</p>`
2. Menu card `<span class="card-version">vX.X</span>`
3. Menu `openApp('Ecom_vX.X.html')` and the filename itself

Deploying updates

1. Edit the file locally or in the GitHub web editor
2. Upload/commit to the `main` branch
3. GitHub Pages redeploys automatically — live within ~60 seconds
4. All users get the update on next browser refresh — no sharing needed

Use clear commit messages: `Ecom v2.4 – added export button` not `Update files`

Pending work

- ☐ Export button + `exportForDash()` in each of the 4 processors — see `handoff_spec.md`
- ☐ MegaDash card added to Menu — see `handoff_spec.md §4`
- ☐ Full Report expansion to Reserve, ItemPrep, Receiving (matching Ecom)
- ☐ Selectable sub-dept number squares with inline detail
- ☐ Weekly history panel inside each dept app (self-comparison for dept leaders)
- ☐ Changelog panel on Menu fed by `changelog.json`
- ☐ CSV pre-flight validator (standalone adjacent tool)
- ☐ Shared OneDrive folder setup for MegaDash auto-load

Known issues

- ItemPrep, Receiving, Reserve have mismatched version strings in HTML titles vs filenames — fix during next update pass
- Reserve shift selector is hardcoded to 2nd shift only

- Day Report removed from Ecom v2.3 — `addToDayReport`, `getDayData`, `renderDayReport` no longer exist in Ecom. Other apps (Reserve, ItemPrep, Receiving) still have Day Report
