

DC499 Reporting Suite — Progress Log

Session date: 2026-06-23

Working with: Backup Claude (Dean's main Claude was at usage limit)

Handoff to: Dean + main Claude when access resumes

Context

Dean Karim built a 5-file browser-based warehouse reporting suite for DC499. Files run locally (no backend), use PapaParse for CSV parsing and Chart.js for charts. All state is in localStorage. The suite processes WM portal CSV exports and shows per-dept unit metrics and goal attainment by associate.

Current suite files:

- `Menu_v1.5.html` — navigation hub
- `Ecom_v2.3.html` — Replenishment, Putaway, Full Report (6 sub-depts)
- `Reserve_v1.4.html` — Picking, Replenishment
- `ItemPrep_v1.9.html` — Item Level Receive, Condition Code
- `Receiving_v1.6.html` — LPN Receive

Known issues flagged (do not fix without Dean):

- Version strings inside ItemPrep, Receiving, Reserve HTML titles/footers don't match filenames — confirm which is current before bumping
 - Ecom roster 2nd shift key is `sc_roster_2nd_v5` (current); if default roster changes, bump version per Dean's rule
-

What was decided this session

The goal

Build something menu-launchable that benefits operations, is independent of the main suite, but can be integrated cleanly when Dean's access resumes. Not a VTG (would go stale with updates). Not a drag-and-drop merge tool (Dean says that's already built separately).

The architecture decision

A cross-department Shift Dashboard where:

- Each dept app gets a small Export button → produces a tiny JSON payload

- The Shift Dashboard ingests those payloads (file drop OR paste)
- Leaders see a single floor-wide view: total units, goal attainment per dept, units/head

Why not fully automatic yet: Files run locally — there is no shared backend. `localStorage` is device-local, so Dept A's browser cannot see Dept B's. True one-button automation requires hosting (OneDrive folder read, GitHub Pages, or internal server). The dashboard is designed to upgrade to that with zero rework — only the transport layer changes, the payload format stays the same.

Recommended path to OneDrive semi-automation:

Each dept hits Export → file saves to a shared synced Teams/OneDrive folder → leader opens MegaDash → picks that folder once → all JSON files load → dashboard populates. Browser `showDirectoryPicker()` API supports this. Can be added to MegaDash v1.1.

What was built this session

`MegaDash_v1.0.html`

- Fully functional, menu-launchable, matches suite styling (dark default, data-theme CSS vars, same toggle pattern as Ecom)
- Accepts dept payloads via: file drop (.json), paste (payload code), or both
- Shows: total units, depts reported, above/below goal counts, per-dept cards with units, units/head, tab breakdown, progress bars, stale indicator (>60 min)
- Persists state in `localStorage` key `dc499_megadash_v1` — survives page refresh
- Stale detection: dept data older than 60 min shows amber "Stale" badge
- Remove individual dept data with × per card; "Clear all" button at top
- Back button navigates to `Menu_v1.5.html`
- Footer includes "Last Updated" timestamp per org policy

`handoff_spec.md`

Precise instructions for the main Claude to:

1. Add `exportForDash()` function to each of the 4 processors
 2. Add Export button to each app UI
 3. Add MegaDash card + styles to Menu Per-app variable substitution table included.
- Estimated work: ~15 min per app.
-

What's pending (for Dean + main Claude)

- ☐ Add Export button + `exportForDash()` to Ecom v2.3 — see handoff_spec.md §3
 - ☐ Add Export button + `exportForDash()` to Reserve v1.4 — see handoff_spec.md §3
 - ☐ Add Export button + `exportForDash()` to ItemPrep v1.9 — see handoff_spec.md §3
 - ☐ Add Export button + `exportForDash()` to Receiving v1.6 — see handoff_spec.md §3
 - ☐ Add MegaDash card to Menu_v1.5.html — see handoff_spec.md §4
 - ☐ Confirm/fix version string mismatches in ItemPrep, Receiving, Reserve internal titles
 - ☐ (Future v1.1) Add `showDirectoryPicker()` folder-load path to MegaDash for OneDrive semi-automation
 - ☐ (Future) Consider GitHub Pages hosting for full one-button automation
-

Payload format reference

```
json
{
  "dept":      "ecom",
  "shift":     "2nd",
  "date":      "2026-06-23",
  "exportedAt": 1719100000000,
  "units":     1240,
  "goal":      1400,
  "tabs": [
    { "label": "Replenishment", "units": 820 },
    { "label": "Putaway",       "units": 420 }
  ],
  "roster":    25,
  "version":   "2.3"
}
```

`dept` must be one of: `ecom`, `reserve`, `itemprep`, `receiving` (lowercase).
